FRAME CONTRACTING ARE EXPERIENCED APPLICATORS OF INTUMESCENT SYSTEMS OVER TIMBER SURFACES

It's commonly understood that Intumescent coating systems are an essential component of structural steel systems in new buildings but in many situations it's also a requirement that timber surfaces are protected by a suitably rated intumescent system also.

Frame Contracting's experienced spray team have completed a number of projects where a IFR or 2FR rated system has been required over load bearing or non load bearing timber structures.

Timber surfaces can be precoloured prior to application or left in their natural state.

Careful attention and time is taken to ensure that the correct wet film thickness (W FT) is applied and detailed verification documentation maintained.

Frame have developed sophisticated temperature control equipment to ensure that the system is applied at the correct temperature and therefore ensure optimum coverage and wet film thickness.

If your project has a timber system that requires a professionally applied intumescent coatings system, let Frame Contracting advise you on that as a part of a complete project painting package.
